

## Russia

The Voice of Russia reduced in DRM output to Europe in the A07 plan.

The Voice of Russia has been a regular broadcaster in English French , Russian and German on DRM from Taldom near Moscow using a modified transmitter. Broadcasts total about 8 hours per day. Taldom is also used by Deutsche Welle as a relay site. In late 2005 Taldom acquired a second DRM capable transmitter that came into service with the VoR early in 2006.

VoR is the only broadcaster operating a DRM transmitter in simulcast mode where both the analogue and digital signals are broadcast as independent sidebands in a standard 9 kHz channel. These broadcasts originate from Oranienburg in Germany and are on 693 kHz. This has been ratified as the standard for the DRM simulcast mode.

RTRN ( the Russian Television and Radio Network) has conducted some test transmissions from Novosibirsk on short wave. There was a report of a test transmission to Japan in January 2007 and there have been regular transmissions from Komsomolsk Amur during the early part of 2007.
