

Spain

There has been little activity from the national domestic service other than a short test on mobile reception of DRM from a RNE transmitter on 1359 kHz outside Madrid.

The commercial network COPE was considering testing DRM on 1269 kHz but nothing has been reported. 1269 kHz is a multi-transmitter network so perhaps it has proved difficult or too costly to convert it to a DRM based Single Frequency Network.

SER has been testing a Multi-Channel Simulcast on 1251/1260 kHz.

REE has used DRM to Europe in the both the B07 and A08 seasons in the morning. The Nobeljas transmitter puts a powerful signal into western Europe.
